Family Cydnidae (Insecta: Heteroptera) in the Natural History Museum in Belgrade

LJILJANA PROTIĆ

Natural History Museum Belgrade, Serbia e-mail: protic@nhmbeo.org.yu

ABSTRACT At the Natural History Museum in Belgrade there are specimens of 28 species from family Cydnidae, which were mostly collected in Serbia and neighboring Balkan countries. Three species are recorded as new for the Heteropteran fauna of Serbia: *Byrsinus pilosulus* (KLUG), *Macroscytus brunneus* (FABRICIUS) and *Legnotus fumigatus* (A. COSTA). Additions are made to the Catalogue of Heteroptera of Palaearctic Region, as follows: the occurrence of *Cydnus aterrimus* (FORSTER) in Canary Islands is confirmed, *Geotomus brunnipennis* WAGNER and *Ochetostethus balcanicus* WAGNER are recorded for the first time from Bosnia-Herzegovina, *G. elongatus* (HERRICH-SCHAEFFER) for the first time from Cyprus and Albania. The problem with the previous citation of Yugoslavia (YU) in the Catalogue of Heteroptera of Palearctic Region is now resolved.

KEY WORDS: Heteroptera, Cydnidae, Albania, Canary Islands, Cyprus, Serbia, former Yugoslavia, distribution, new records.

INTRODUCTION

In Serbia, the family Cydnidae has not been studied so far specifically. There are some data on individual specimens and records within the papers (HORVÁTH 1903, KORMILEV 1928/29, 1936; PROTIĆ 1988/89, 1993/94) on Heteroptera of Serbia. The Catalogue (PROTIĆ 2001) combines the data on records of Cydnidae species in the region of Ex-Yugoslavia. This paper presents the specimens not published within the Catalogue of Heteroptera of Ex-Yugoslavia (PROTIĆ 2001), as well as the unpublished data on specimens collected outside the boundaries of Ex-Yugoslavia which are kept in the collections of Natural History Museum in Belgrade.

The family Cydnidae has a special significance for the history of faunistic studies of Heteroptera in Serbia, as *Crocistethus aereus* FIEBER, 1861 was described from the territory

of Serbia. Later on it was decided that this was the synonym of the species *C. waltianus* (FIEBER 1837). The specimen from Serbia was collected by Herman Schmidt Göbl. This is still the only record of this species from Serbia.

The specimens of the family Cydnidae are kept in several separate collections at the Natural History Museum: Study Collection [SZ], Collection of Institute for Plant Conservation in Belgrade [ZB], as well as in the collections by important entomologists: Nikola Kormilev [NK], Petar Novak [PN], Guido Nonveiller [GN], Jovan Stančić [JS] and Ljubodrag Janković [LJJ]. Also included in this analysis are the specimens from the Heteroptera collection at Land Museum of Bosnia-Herzegovina in Sarajevo [ZMBH].

The main goal of this paper was to publish combined data on representatives of the family Cydnidae kept in many different collections and many boxes within the whole Entomological Collection. Once all the specimens were brought together, the revision was performed, and the published results have increased the present knowledge on distribution of certain species.

RESULTS

These results include new, so far unpublished data on distribution of certain species from family Cydnidae, present in the Heteroptera collections of Natural History Museum in Belgrade. During the revision, numerous papers were used as references, dealing either with individual species or genera from family Cydnidae (JOSIFOV 1980, 1981, 1986, 1986a; KERZHNER 2003; KIS 1984; LINNAUORI 1993; LIS 1989, 1999, 2006; MAGNIEN 2006; RIZZOTTI VLACH 1995; STEHLIK 1983; STICHEL 1961; ŠTYS 1963; WAGNER 1940, 1951, 1953, 1954, 1956, 1960a). The abbreviations of the countries are according to AUKEMA & RIEGER (2006).

DISCUSSION

The Heteroptera collections at Natural History Museum in Belgrade include 28 species of family Cydnidae, collected mostly in Serbia and neighboring Balkan countries (Albania, Bosnia-Herzegovina, Croatia, Macedonia, Montenegro, Slovenia), while only few were from Austria, Italy, Germany, Canary Islands, Cyprus, Tunisia, Morocco, Spain. Altogether 344 specimens were processed, collected from 1921 to 2006.

New localities were determined for 25 species included in the Catalogue (PROTIĆ 2001), as well as 11 new records at already known localities (Table 1).

Changes were made in former citations of *Geotomus caucasicus* (KOLENATI) and *G. ciliatitylus* SIGNORET according to latest literature sources (KERZHNER 2003, LIS 2006).

Cydnus aterrimus (FORSTER) was not cited in the Catalogue of Heteroptera of Palearctic Region (LIS 2006) for the Canary Islands, although it was cited by LIS (1999).

Geotomus brunnipennis WAGNER – new data for Bosnia-Herzegovina and the Catalogue (PROTIĆ 2001).

Geotomus elongatus (HERRICH-SCHAEFFER) was identified in the collections of Natural History Museum with specimens collected at Cyprus, and these are new data for Catalogue of Heteroptera of Palearctic Region (LIS 2006). The collection of Land Museum of Bosnia-Herzegovina in Sarajevo also includes a specimen from Albania (Pulaj) – also new data for Catalogue of Heteroptera of Palearctic Region (LIS 2006). The specimen from Prokletije, from the collection of Nikola Kormilev, is the second record of this species in Montenegro.

Geotomus brunipennis WAGNER and *Geotomus punctulatus* (A. COSTA) were collected in Herzegovina in the same localities and habitats. These are Mediterranean species. Only *G. brunipennis* was recorded in Serbia, more than 100 years ago, also at a warm habitat in Bela Palanka (BALARIN 1963). The specimen is present in the Land Museum of Bosnia-Herzegovina in Sarajevo.

Macroscytus brunneus (FABRICIUS) is a new species for fauna of Serbia, discovered in the collection of Natural History Museum within the unprepared material from 1978.

Linospa orbicularis (JAKOVLEV) is a species absent from Europe, while the collection by Nikola Kormilev includes a single specimen from Tunisia (PROTIĆ 1987).

Adomerus biguttatus (LINNAEUS) – data on specimens of this species were already published in the previous papers, except for the specimen from Germany present in the collections of PETAR NOVAK.

Canthophorus dubius (SCOPOLI) – the specimen from Strumica collected by Kormilev on September 21st, 1934, was mistakenly cited in the paper (PROTIĆ 1987b) as *Sehirus luctuosus* MULSANT & REY.

Canthophorus maculipes MULSANT – one specimen is present in the collection by Kormilev, acquired by exchange with Michalk from island Ischia in Italy. In the region of Ex-Yugoslavia this species was recorded only in the northern coastal area of Istria, locality Rijeka (HORVÁTH 1907).

Morphometric measurements were performed on species from genus *Legnotus*, with additional corrections cited in the results. *Legnotus fumigatus* (COSTA) is a new species for fauna of Serbia, recorded at the localities Trgovište, Devojački Bunar and Banatski Karlovac. The specimen from Banatski Karlovac was before this revision recorded as *L. picipes* (FALLÉN) (PROTIĆ 1994).

Legnotus limbosus (GEOFFROY) - after the revision of Kormilev's collection, it was recognized that the specimen collected at Galičica on July 11th, 1936, was mistakenly identified as *L. fumigatus* (COSTA). The Study Collection included a specimen collected at Besna Kobila on July 13th, 1985, mistakenly identified as *L. picipes* (FALLÉN). Since 1994, my colleague Stojanović has collected over 30 specimens of this species in the broader surroundings of Belgrade.

Legnotus picipes (FALLÉN) – In this species there were also some changes after the revision of specimens from Kormilev's collection. It now also includes specimens collected at Skopje on June 30th, 1936, and on Pelister on July 24th, 1936, which were previously determined as *L. fumigatus* (COSTA).

Ochetostethus balcanicus WAGNER is a new species for fauna of Bosnia-Herzegovina. The revision of specimens of *O. opacus* showed that the specimens from localities: Leskovac, Skopje, Radika, Katlanovo, Valandovo, Mavrovi Hanovi and Rava Islands were actually *O. balcanicus*. At the time when they were collected and identified by Kormilev, *O. balcanicus* still was not described as a species and there was only *O. nanus* (HERRICH-SCHAEFFER). According to the new systematics it is *O. opacus*. According to data collected by LIS (2006), this "species is distributed in the south-western parts of the Mediterranean subregion; records from other European regions pertain to *O. opacus* (SCHOLTZ)".

Ochetostethus pygmaeus (RAMBUR) - the collection by PETAR NOVAK includes a specimen from Italy.

The Catalogue (PROTIĆ 2001) cites the species *Sehirus ovatus* (HERRICH-SCHAEFFER) from Croatia and *Tritomegas rotundipennis* Dohrn from Slovenia, but they still have not been recorded in Serbia and there are no specimens in the collections of Natural History Museum.

Table 1. List of Cydnidae registered up to now in the Heteroptera collections of Natural History Museum in Belgrade, then in the Republic Serbia, and corrections in species distribution.

CONCLUSIONS

The Heteroptera collections at the Natural History Museum in Belgrade include 28 species of family Cydnidae. Altogether 344 specimens were analyzed. They were collected in the period 1921-2006. The collections also include specimens collected outside of boundaries of Serbia and Ex-Yugoslavia. These specimens were collected by cited collectors-entomologists on their travels, or alternatively they were obtained by exchange with colleagues from other European countries.

Following species were determined as new for fauna of Serbia: *Byrsinus pilosulus* (KLUG), *Macroscytus brunneus* (FABRICIUS) and *Legnotus fumigatus* (A. COSTA), as well as for the Catalogue of Heteroptera (PROTIĆ 2001): *Byrsinus pilosulus* (KLUG), *Geotomus brunipennis* WAGNER, *Geotomus punctulatus* (A. COSTA), *Macroscytus brunneus* (FABRICIUS), *Legnotus fumigatus* (A. COSTA) and *Legnotus limbosus* (GEOFFROY).

For three species, there is some increase in knowledge of their range, when compared with the Catalogue of Heteroptera of Palearctic Region (LIS 2006): *Geotomus brunipennis* WAGNER is distributed in Bosnia-Herzegovina (BH), *Geotomus elongatus* (HERRICH-SCHAEFFER) in Albania and in Cyprus (AL, CY) and *Ochetostethus opacus* (SCHOLTZ) in Morocco (MO).

This paper also includes the distinction in citing certain species from the Catalogue of Heteroptera of Palearctic Region (LIS 2006) which were included in the state YU, which pertained to Serbia and Montenegro. Now the citations are precisely determined for either Serbia (RS) and/or Montenegro (ME).
